Application for Graduate Software and Automation Engineer - Paolo Imbriani

Personal Information

- Name: Paolo Imbriani
- Date of Birth: June 21, 2004, Reggio di Calabria (RC), Italy.
- Current position: Student at University of Verona, Italy.
- Email: imbriani.paolo@hotmail.com
- Phone: +39 348 640 7403
- Official Website: <https://imbrianipaolo.com>
- LinkedIn: <https://www.linkedin.com/in/paolo-imbriani-ba1b7b215/>
- Github: <https://github.com/MagiHotline>
- Citizenship: Italian

I am writing to apply for the Graduate Software and Automation Engineer position at Arm in Nice. I have long admired the innovations emerging from the Sophia Antipolis design centre, particularly the development of the Arm Cortex CPUs that power our connected world. I am drawn to Arm's highly creative and collaborative engineering culture, and I am particularly excited by the opportunity to optimize continuous integration and automated execution workflows for CPU design validation.

My strong foundation in computer science and passion for systems programming align with the demands of this role. At the University of Verona, alongside my core coursework in algorithms and software engineering, I have cultivated a deep interest in low-level architecture and hardware. Through my active involvement in the game decompilation and reverse engineering community, I frequently analyze PowerPC assembly and navigate complex hardware interactions using tools like Ghidra. Furthermore, I have hands-on experience building systems-level tools, such as developing a custom ISO compression utility in Rust. This combination of low-level hardware curiosity and practical software development skills positions me well to support and improve internal tools and final customer package validation.

Beyond technical execution, I thrive in upbeat, delivery-oriented environments. During High School, I participated in the Da Vinci 4.0 Hackathon organized by Giornale di Brescia. Working in a team, we developed a remote teaching web application called HIVE, securing 2nd place. The following year, I collaborated with my team to build MOSSION, a sustainable and technologically advanced moss wall, earning 1st place. These experiences taught me how to communicate ideas clearly, integrate innovative technologies, and manage project deadlines efficiently, skills I am eager to bring to Arm's software automation team.

I am highly motivated to bring my enthusiasm for CPU micro-architecture and software automation to the extraordinary environment at Arm. I look forward to the possibility of contributing to your continuous integration infrastructure and learning from the expert engineers in the French Riviera.

Best regards,

Paolo Imbriani
